Analysis of psychological differentials among men football hockey and cricket players

Dr. KA Ramesh

Abstract

The purpose of the study was to analysis the Psychological differentials among men Football, Hockey and Cricket Players. To achieve this purpose of the study ninety (N=90) men players were selected. Among them, thirty (n=30) Football players, thirty (n=30) Hockey players and thirty (n=30) Cricket players who have participated in the Anna University Inter Collegiate tournament during the year 2014-2015 were selected as subjects. The age of the subjects were ranged from 18 to 21 years. Among the Psychological factors only Aggression, Self-Esteem and Social Adjustment were selected as criterion variables. Aggression was assessed by Sports Aggression Inventory constructed and standardized by Prof. Anand Kumar Shrivastava & Prem Shankar Shukla. Self-esteem was assessed by the total scores in Canadian Self Esteem Inventory (CSEI) developed by Dr. Ambika Prasad Pandey and Social adjustment was assessed by the total scores in Deva's Social Adjustment Inventory (SAI) constructed by Dr. R.C. Deva. The data collected from the three groups was statistically analyzed by using Analysis of variance (ANOVA). Scheffe's post hoc test was applied to determine the significant difference between the paired means. In all the cases 0.05 level of confidence was fixed significance was fixed. The results of the study showed that there was a significant difference among Football, Hockey and Cricket Players.

Keywords: Aggression; Self Esteem; Social Adjustment

1. Introduction

Sports have become a psycho- social activity. Physical strength and skill are not the only factors determining the outcome of competition. The psychological variables play an important role in inducing sportsmen to exhibit best possible performance during competition, such as conducting research in sports and in predicting success in sports. Variables such as personality, aggression, self-esteem, achievement motivation, self-confidence, social adjustment, locus of control and self-concept may play a great role to shape up an individual of the society.

Sports psychology is the scientific study of behavior in sports or sports related context. It is an attempt to understand the how and why underlying sports behavior⁸. Sports psychology is defined as the study of mental processes as they relate to human sports performance. It consists of theories and laws of learning the importance of reinforcement and the linking of perceptual abilities with motor performance contribute to the body of knowledge. Sports psychologists utilize the information when studying topics such as achievement motivation, arousal, attribution and personality development (Lumpkin, 1986) ^[6].

There are many perspectives through which sport can be viewed. Therefore, very often some binary divisions are stressed, such as: professional-amateur, mass-top-level, active-passive/spectator, men-women, sports-play (as an antithesis to organized and institutionalized activity). (Lueschen, 1980) ^[5].

2. Methodology

To achieve this purpose of the study ninety (N=90) men players were selected. Among them, thirty (n=30) Football players, thirty (n=30) Hockey players and thirty (n=30) Cricket players who have participated in the Anna University Inter zonal tournament during the year 2014-2015 were selected as subjects. The age of the subjects were ranged from 18 to 21 years. Among various Psychological factors only Aggression, Self-Esteem and Social adjustment were selected as criterion variables.

Aggression was assessed by Sports Aggression Inventory constructed and standardized by Prof. Anand Kumar Shrivastava & Prem Shankar Shukla (1985). Sports Aggression inventory consists of 25 questions. Self-Esteem was assessed by the total scores in Canadian Self Esteem Inventory (CSEI) developed by Dr. Ambika Prasad Pandey (1989) [8], Canadian Self Esteem Inventory (CSEI) contains 40 items and Social adjustment was assessed by the total scores in Deva’s Social Adjustment Inventory (SAI).Diva’s Social Adjustment Inventory (SAI) consists of 100 questions which includes items for the assessment of emotional as well as social adjustment.

3. Analysis of the Data

The data collected from the Football players, Hockey players and Cricket players on selected Criterion variables were statistically examined by analysis of variance (ANOVA) was used to determine differences, if any among the means on selected criterion variables separately. Whenever they obtained f-ratio value was significant the Scheffe’s test was applied as post hoc test to determine the paired mean differences, if any. In all the cases .05 level of confidence was fixed significance was fixed.

The Analysis of variance (ANOVA) selected Psychological factors such as Aggression, Self Esteem and Social adjustment have been analyzed and presented in Table -1.

Table 1: Values of Analysis of Variance on the Means obtained in form of Football Hockey and Cricket players on selected Psychological factors

Certain Variables	Anna University Players			Source of Variance	Sum of Squares	df	Mean Squares	‘F’ Ratio
	Football Players	Hockey Players	Cricket Players					
Aggression	20.67	18.63	14.97	Between With in	500.69 756.60	2 87	250.34 8.70	28.79*
Self Esteem	28.27	26.23	23.03	Between With in	417.62 988.20	2 87	208.81 11.36	18.38*
Social Adjustment	163.83	156.87	136.50	Between With in	12104.47 32991.13	2 87	6052.23 379.21	15.96*

* Significant at .05 level of confidence

(The table value required for Significance at 0 .05 level with df 2 and 87 is 3.10)

Table-1 shows that the mean value of Aggression, Self-Esteem and Social adjustment for Football, Hockey and Cricket players were 20.67, 18.63, 14.97, 28.27, 26.23, 23.03, 163.83, 156.87 and 136.50 respectively. The obtained F values 28.79, 18.38 and 15.96 for the mean is more than the table value 3.10 for df 2 and 87 required for significance at .05 level of confidence. The results of the study indicate that

there is a significant difference among the means values of Football, Hockey and Cricket players on the Aggression, Self-esteem and Social adjustment.

To determine which of the paired means had a significant differences, Scheffe’s test was applied as Post hoc test and the results are presented in Table 2.

Table 2: Ordered Scheffe’s Post Hoc on Aggression, Self Esteem and Social Adjustment among Anna University Football, Hockey and Cricket players

Certain Variables	Anna University Players			Mean Difference	Confidence Interval
	Football Players	Hockey Players	Cricket Players		
Aggression	20.67	18.63		2.04*	1.94
	20.67		14.97	5.70*	1.94
		18.63	14.97	3.66*	1.94
Self Esteem	28.27	26.23		2.04	2.22
	28.27		23.03	5.24*	2.22
		26.23	23.03	3.20*	2.22
Social Adjustment	163.83	156.87		6.96	12.83
	163.83		136.50	27.83*	12.83
		156.87	136.50	21.37*	12.83

* Significant at 0.05 level of confidence

Table-2 shows that the mean for differences on Football players and Hockey players, Football players and Cricket players and Hockey players and Cricket players on Aggression were 2.04, 5.70 and 3.66 respectively. The values are greater than the confidence interval value 1.94, which shows significant differences at 0.05 level of confidence.

The mean for differences on Football players and Cricket players and Hockey players and Cricket players on Self-Esteem were 5.24 and 3.20 respectively. The values are greater than the confidence interval value 2.22, which shows significant differences at .05 level of confidence. The value between Football players and Hockey players are 2.04, it showed insignificance differences.

Further the table 2 shows that the mean for differences on Football players and Cricket players and Hockey players and Cricket players on Social adjustment were 27.83 and 21.37 respectively. The values are greater than the confidence interval value 12.83, which shows significant differences at .05 level of confidence. The value between Football players and Hockey players are 6.96, it showed insignificance differences.

The means values of Football, Hockey and Cricket players on Aggression, Self -Esteem and Social adjustment are graphically represented in the Figure -1.

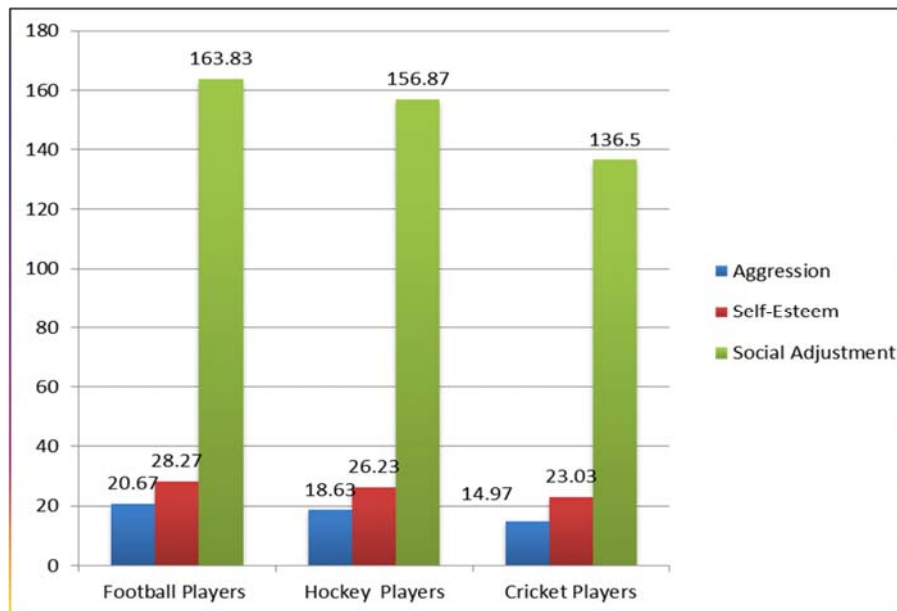

Fig 1: Means Values of Football, Hockey and Cricket players on Aggression, Self-Esteem and Social adjustment

4. Results and Discussion

The results of the study indicate that the three groups i.e. Football, Hockey and Cricket players had showed significantly differences on all the selected criterion variables namely Aggression, Self-Esteem and Social Adjustment. It is also found that the improvement achieved by the Football players was greater when compared to Hockey and Cricket players. These results are in conformity with the findings of the following studies undertaken by Inverson (1981) ^[4] Reddy, (2009) ^[9], Costello (2000) ^[3], Mohan and Avtar (1986) ^[7] and Chan (2003.) ^[2]

5. Conclusion

Based on the results of the study the following conclusions were drawn.

- 1) There was a significant difference among Anna University men Football, Hockey and Cricket players on Aggression, Self-Esteem and Social Adjustment.
- 2) Football players were found to be better than the Hockey and Cricket players in increase Aggression, Self-Esteem and Social Adjustment.
