## Some forms of nano generalized b-closed maps in nano topological spaces

**M Dhanapackiam and M Trinita Pricilla**

### Abstract

In this paper we introduce the concept of nano\*generalized b-closed maps and we obtain the basic properties and their relationships with other forms of nano\*generalized b-closed maps in nano topological spaces

**Keywords:** Nano\*generalized b-closed maps, almost nano\*generalized b-closed maps, strongly nano\*generalized b-closed maps.

### 1. Introduction

Levine<sup>[1]</sup> derived the concept of generalized closed sets in topological space. Al Omari and Mohd. Salmi Md. Noorani<sup>[2]</sup> studied the class of generalized b-closed sets. The notation of nano topology was introduced by Lellis Thivagar<sup>[10]</sup> which was defined in terms of approximations and boundary regions of a subset of an universe using an equivalence relation on it and also defined nano closed sets, nano interior and nano-closure. Nano gb-closed set was initiated by Dhanis Arul Mary and I. Arockiarani<sup>[6]</sup>. The purpose of the paper is to introduce and investigate some of the fundamental properties of nano\*generalized b-closed maps and almost nano\*generalized b-closed maps, strongly nano\*generalized b-closed maps and study some of its properties.

### 2. Preliminaries

**2.1 Definition<sup>[15]</sup>:** Let  $U$  be a non-empty finite set of objects called the universe and  $R$  be an equivalence relation on  $U$  named as the indiscernibility relation. Then  $U$  is divided into disjoint equivalence classes. Elements belonging to the same equivalence class are said to be indiscernible with one another. The pair  $(U, R)$  is said to be the approximation space. Let  $X \subseteq U$

1. The lower approximation of  $X$  with respect to  $R$  is the set of all objects, which can be for certainly classified as  $X$  with respect to  $R$  and it is denoted by  $L_R(X)$ . That is  $L_R(X) = \bigcup_{x \in U} \{R(x) : R(x) \subseteq X\}$ , where  $R(x)$  denotes the equivalence class determined

by  $X \in U$  2. The upper approximation of  $X$  with respect to  $R$  is the set of all objects, which can be possibly classified as  $X$  with respect to  $R$  and it is denoted by  $U_R(X)$ . That is  $U_R(X) = \bigcup_{x \in U} \{R(x) : R(x) \cap X \neq \emptyset\}$

3. The boundary of  $X$  with respect to  $R$  is the set of all objects, which can be classified neither as  $X$  nor as not- $X$  with respect to  $R$  and it is denoted by  $B_R(X)$ . That is  $B_R(X) = U_R(X) - L_R(X)$ .

**Definition 2.2<sup>[10]</sup>:** If  $(U, R)$  is an approximation space and  $X, Y \subseteq U$ , then

(i)  $L_R(X) \subseteq X \subseteq U_R(X)$

- (ii)  $L_R(\varphi) = U_R(\varphi) = \varphi$  and  $L_R(U) = U_R(U) = U$
- (iii)  $U_R(X \cup Y) = U_R(X) \cup U_R(Y)$
- (iv)  $U_R(X \cap Y) \subseteq U_R(X) \cap U_R(Y)$
- (v)  $L_R(X \cup Y) \supseteq L_R(X) \cup L_R(Y)$
- (vi)  $L_R(X \cap Y) = L_R(X) \cap L_R(Y)$
- (vii)  $L_R(X) \subseteq L_R(Y)$  and  $U_R(X) \subseteq U_R(Y)$  whenever  $X \subseteq Y$
- (viii)  $U_R(X^c) = [L_R(X)]^c$  and  $L_R(X^c) = [U_R(X)]^c$
- (ix)  $U_R U_R(X) = L_R U_R(X) = U_R(X)$
- (x)  $L_R L_R(X) = U_R L_R(X) = L_R(X)$

**2.3 Definition** <sup>[9]</sup>: Let  $U$  be non-empty, finite universe of objects and  $R$  be an equivalence relation on  $U$ . Let  $X \subseteq U$ . Let  $\tau_R(X) = \{U, \varphi, L_R(X), U_R(X), B_R(X)\}$ . Then  $\tau_R(X)$  is a topology on  $U$ , called as the nano topology with respect to  $X$ . Elements of the nano topology are known as the nano-open sets in  $U$  and  $(U, \tau_R(X))$  is called the nano topological space.  $[\tau_R(X)]^c$  is called as the dual nano topology of  $\tau_R(X)$ . Elements of  $[\tau_R(X)]^c$  are called as nano closed sets.

**2.4 Definition** <sup>[10]</sup>: If  $\tau_R(X)$  is the nano topology on  $U$  with respect to  $X$ , then the set  $B = \{U, L_R(X), U_R(X), B_R(X)\}$  is the basis for  $\tau_R(X)$

**2.5 Definition** <sup>[10]</sup>: If  $(U, \tau_R(X))$  is a nano topological space with respect to  $X$  where  $X \subseteq U$  and if  $A \subseteq U$ , then the nano interior of  $A$  is defined as the union of all nano-open subsets of  $A$  and it is denoted by  $N \text{int}(A)$ . That is  $N \text{int}(A)$ , is the largest nano open subset of  $A$ . The nano closure of  $A$  is defined as the intersection of all nano closed sets containing  $A$  and is denoted by  $Ncl(A)$ . That is  $Ncl(A)$ , is the smallest nano closed set containing  $A$ .

**2.6 Definition** <sup>[6]</sup>: A subset  $A$  of a nano topological space  $(U, \tau_R(X))$  is called nano generalized b-closed (briefly, nano gb-closed), if  $Nbcl(A) \subseteq V$  whenever  $A \subseteq V$  and  $V$  is nano open in  $U$ .

**2.7 Definition** <sup>[7]</sup>: A subset  $A$  of a nano topological space  $(U, \tau_R(X))$  is called nano\*generalized b-closed if  $Nbcl(A) \subseteq V$  whenever  $A \subseteq V$  and  $V$  is nano gb-open in  $U$

**2.8 Definition** <sup>[10]</sup>: Let  $(U, \tau_R(X))$  be a nano topological space and  $A \subseteq U$ . Then  $A$  is said to be Nano semi open If  $A \subseteq Ncl(N \text{int}(A))$

Nano pre-open if  $A \subseteq N \text{int}(Ncl(A))$

Nano  $\alpha$ -open if  $A \subseteq N \text{int}(Ncl(N \text{int}(A)))$

Nano b-open if  $A \subseteq Ncl(N \text{int}(A)) \cup N \text{int}(Ncl(A))$

Nano regular-open if  $A = N \text{int}(Ncl(A))$

**2.9 Definition:** Let  $(U, \tau_R(X))$  and  $(V, \tau_R(Y))$  be a nano topological spaces, then a map  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  is said to be

- (i) Nano continuous if  $f^{-1}(V)$  is nano closed in  $(U, \tau_R(X))$  for each nano closed set  $V$  in  $(V, \tau_R(Y))$
- (ii) Nano\*generalized b-continuous if  $f^{-1}(V)$  is nano b-closed in  $(U, \tau_R(X))$  for each nano closed set  $V$  in  $(V, \tau_R(Y))$ .

**2.10 Definition:** A bijection  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  is called nano-homeomorphism if  $f$  is both nano-continuous and nano-open.

### 3. NANO\*GENERALIZED b-CLOSED MAPS

**3.1 Definition:** A map  $f:(U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  is said to be nano\*generalized b-closed if the image of every nano closed set in  $(U, \tau_R(X))$  is nano\*generalized b-closed in  $(V, \tau_R(Y))$ .

**3.2 Definition:** A map  $f:(U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  is said to be nano\*generalized b-open if  $f(A)$  is nano\*generalized b-open for each nano open set  $A$  in  $(U, \tau_R(X))$ .

#### 3.3 Theorem

- (i) Every nano closed map is nano\*generalized b-closed map.
- (ii) Every nano c-closed map is nano\*generalized b-closed
- (iii) Every nano r-closed map is nano\*generalized b-closed map.
- (iv) Every nano pre-closed map is nano\*generalized b-closed map.
- (v) Every nano semi closed map is nano\*generalized b-closed map.
- (vi) Every nano  $\alpha$ -closed map is nano\*generalized b-closed map.

**Proof:** Let  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  be a nano closed map. Let  $B$  be nano closed set in  $U$ , Since  $f$  is nano closed map then  $f(B)$  is nano closed set in  $V$ . We know that every nano closed set is nano\* generalized b-closed, then  $f(B)$  is nano\* generalized b-closed in  $V$ . Therefore  $f$  is nano\* generalized b-closed map. Proof is obvious for others.

**3.4 Remark:** The Converse of the above theorem need not be true. It is shown by the following examples.

**3.5 Example:** Let  $U = \{a, b, c, d\}$  with  $U/R = \{\{b\}, \{c\}, \{a, d\}\}$ . Let  $X = \{a, c\} \subseteq U$ . Then  $\tau_R(X) = \{U, \Phi, \{c\}, \{a, d\}, \{a, c, d\}\}$ . Let  $V = \{a, b, c, d\}$  with  $V/R' = \{V, \Phi, \{a\}, \{c\}, \{b, d\}\}$ . Let  $Y = \{a, b\} \subseteq V$ . Then  $\tau_R(Y) = \{V, \Phi, \{a\}, \{b, d\}, \{a, b, d\}\}$ . Define  $f:(U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  be a function defined by  $f(a)=a, f(b)=c, f(c)=d, f(d)=b$ . Here  $f$  is nano\*generalized b-closed map but not nano closed map. Since  $A = \{b, c\}$  is closed in  $(U, \tau_R(X))$  but  $f(\{b, c\}) = \{c, d\}$  is nano\*generalized b-closed set but not nano closed set in  $(V, \tau_R(Y))$ .

**3.6 Example:** Let  $U = \{a, b, c\}$  with  $U/R = \{\{b\}, \{a, c\}\}$ . Let  $X = \{a, b\} \subseteq U$ . Then  $\tau_R(X) = \{U, \Phi, \{b\}, \{a, c\}\}$ . Let  $V = \{a, b, c\}$  with  $V/R' = \{\{a\}, \{b, c\}\}$ . Let  $Y = \{a, c\} \subseteq V$ . Then  $\tau_R(Y) = \{V, \Phi, \{a\}, \{b, c\}\}$ . Define  $f:(U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  be a function defined by  $f(a)=b, f(b)=c, f(c)=a$ . Here  $f$  is nano\*generalized b-closed map but not nano c-closed map. Since  $A = \{a, c\}$  is closed in  $(U, \tau_R(X))$  but  $f(\{a, c\}) = \{a, b\}$  is nano\*generalized b-closed set but not nano c-closed set in  $(V, \tau_R(Y))$ .

**3.7 Example:** Let  $U = \{a, b, c\}$  with  $U/R = \{\{c\}, \{a, b\}\}$ . Let  $X = \{a, c\} \subseteq U$ . Then  $\tau_R(X) = \{U, \Phi, \{c\}, \{a, b\}\}$ . Let  $V = \{a, b, c\}$  with  $V/R' = \{\{a\}, \{b, c\}\}$ . Let  $Y = \{a, c\} \subseteq V$ . Then  $\tau_R(Y) = \{V, \Phi, \{a\}, \{b, c\}\}$ . Define  $f:(U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  be a function defined by  $f(a)=a, f(b)=b, f(c)=c$ . Here  $f$  is nano\*generalized b-closed map but not nano r-closed map. Since  $A = \{c\}$  is closed in  $(U, \tau_R(X))$  but  $f(\{c\}) = \{c\}$  is nano\*generalized b-closed set but not nano r-closed set in  $(V, \tau_R(Y))$ .

**3.8 Example:** Let  $U = \{a, b, c, d\}$  with  $U/R = \{\{c\}, \{d\}, \{a, b\}\}$ . Let  $X = \{a, d\} \subseteq U$ . Then  $\tau_R(X) = \{U, \Phi, \{d\}, \{a, b\}, \{a, b, d\}\}$ . Let  $V = \{a, b, c, d\}$  with  $V/R' = \{\{b\}, \{c\}, \{a, d\}\}$ . Let  $Y = \{b, d\} \subseteq V$ . Then  $\tau_R(Y) = \{V, \Phi, \{b\}, \{a, d\}, \{a, b, d\}\}$ . Define  $f:(U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  be a function defined by  $f(a)=b, f(b)=c, f(c)=d, f(d)=a$ . Here  $f$  is nano\*generalized b-closed map but not nano pre-closed map. Since  $A = \{c, d\}$  is closed in  $(U, \tau_R(X))$  but  $f(\{c, d\}) = \{a, d\}$  is nano\*generalized b-closed set but not nano pre-closed set in  $(V, \tau_R(Y))$ .

**3.9 Example:** Let  $U = \{a, b, c, d\}$  with  $U/R = \{\{a\}, \{c\}, \{b, d\}\}$ . Let  $X = \{a, b\} \subseteq U$ . Then  $\tau_R(X) = \{U, \Phi, \{a\}, \{b, d\}, \{a, b, d\}\}$ . Let  $V = \{a, b, c, d\}$  with  $V/R' = \{\{a\}, \{b\}, \{c, d\}\}$ . Let  $Y = \{a, c\} \subseteq V$ . Then  $\tau_R(Y) = \{V, \Phi, \{a\}, \{c, d\}, \{a, c, d\}\}$ . Define  $f:(U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  be a function defined by  $f(a)=c, f(b)=a, f(c)=b, f(d)=d$ . Here  $f$  is nano\*generalized b-closed map but not nano s-closed map. Since  $A = \{a, c\}$  is closed in  $(U, \tau_R(X))$  but  $f(\{a, c\}) = \{b, c\}$  is nano\*generalized b-closed set but not nano s-closed set in  $(V, \tau_R(Y))$ .

**3.10 Example:** Let  $U = \{a, b, c\}$  with  $U/R = \{\{a\}, \{b, c\}\}$ . Let  $X = \{a, b\} \subseteq U$ . Then  $\tau_R(X) = \{U, \Phi, \{a\}, \{b, c\}\}$ . Let  $V = \{a, b, c\}$  with  $V/R' = \{\{b\}, \{a, c\}\}$ . Let  $Y = \{b, c\} \subseteq V$ . Then  $\tau_R(Y) = \{V, \Phi, \{b\}, \{a, c\}\}$ . Define  $f:(U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  be a function defined by  $f(a)=a, f(b)=b, f(c)=c$ . Here  $f$  is nano\*generalized b-closed map but not nano  $\alpha$ -closed map. Since  $A = \{a\}$  is closed in  $(U, \tau_R(X))$  but  $f(\{a\}) = \{a\}$  is nano\*generalized b-closed set but not nano  $\alpha$ -closed set in  $(U, \tau_R(X))$ .

**3.11 Remark:** If  $f:(U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  is nano\*generalized b-closed map and  $g:(V, \tau_R(Y)) \rightarrow (W, \tau_{R'}(Z))$  is nano\*generalized b-closed map then  $g \circ f:(U, \tau_R(X)) \rightarrow (W, \tau_{R'}(Z))$  need not be nano\*generalized b-closed map in general and this is shown by the following example.

**3.12 Example:** Let  $U=\{a,b,c,d\}$  with  $U/R=\{\{a\},\{b\},\{c,d\}\}$  and  $X=\{b,d\}$ , then  $\tau_R(X)=\{U, \Phi, \{b\}, \{c,d\}, \{b,c,d\}\}$ . Let  $V=\{a,b,c,d\}$  with  $V/R'=\{\{a\},\{c\},\{b,d\}\}$  and  $Y=\{a,b\}$ , then  $\tau_{R'}(Y)=\{V, \Phi, \{a\}, \{b,d\}, \{a,b,d\}\}$  and  $W=\{a,b,c,d\}$  with  $W/R''=\{\{b\},\{c\},\{a,d\}\}$  and  $Z=\{a,c\}$ , then  $\tau_{R''}(Z)=\{W, \Phi, \{c\}, \{a,d\}, \{a,c,d\}\}$ . Define  $f:(U, \tau_R(X)) \rightarrow (V, \tau_{R'}(Y))$  be the function defined by  $f(a)=c, f(b)=b, f(c)=a, f(d)=d$ . and  $g:(V, \tau_{R'}(Y)) \rightarrow (W, \tau_{R''}(Z))$  be the function defined by  $g(a)=a, g(b)=b, g(c)=d, g(d)=c$ . Here  $f$  and  $g$  is nano\*generalized b-closed map, but its composition is not nano\*generalized b-closed map, since  $g \circ f(\{a,c,d\})=\{a,c,d\}$  is not nano\*generalized b-closed map  $(W, \tau_{R''}(Z))$ .

**3.13 Theorem:** If  $f:(U, \tau_R(X)) \rightarrow (V, \tau_{R'}(Y))$  is nano closed map and  $g:(V, \tau_{R'}(Y)) \rightarrow (W, \tau_{R''}(Z))$  is nano\*generalized b-closed map then the composition  $g \circ f:(U, \tau_R(X)) \rightarrow (W, \tau_{R''}(Z))$  is nano\*generalized map.

**Proof:** Let  $B$  be nano closed set in  $(U, \tau_R(X))$ . Since  $f$  is a nano closed map,  $f(B)$  is nano closed set in  $(V, \tau_{R'}(Y))$ . Since  $g$  is nano\*generalized b-closed map,  $g(f(B))$  is nano\*generalized b-closed in  $(W, \tau_{R''}(Z))$ . This implies  $g \circ f$  is nano\*generalized b-closed map.

**Almost Nano\*Generalized b-Closed Map and Strongly Nano\*Generalized b-Closed Map**

**3.14 Definition:** A map  $f:(U, \tau_R(X)) \rightarrow (V, \tau_{R'}(Y))$  is said to be almost nano\*generalized b-closed map if for every nano regular closed set  $F$  of  $(U, \tau_R(X))$ ,  $f(F)$  is nano\*generalized b-closed in  $(V, \tau_{R'}(Y))$ .

**3.15 Definition:** A map  $f:(U, \tau_R(X)) \rightarrow (V, \tau_{R'}(Y))$  is said to be strongly nano\*generalized b-closed map if for every nano\*generalized b-closed set  $F$  of  $(U, \tau_R(X))$ ,  $f(F)$  is nano\*generalized b-closed set  $F$  of  $(V, \tau_{R'}(Y))$ .

**3.16 Definition:** A map  $f:(U, \tau_R(X)) \rightarrow (V, \tau_{R'}(Y))$  is said to be strongly nano\*generalized b-open map if for every nano\*generalized b-open set  $F$  of  $(U, \tau_R(X))$ ,  $f(F)$  is nano\*generalized b-open set  $F$  of  $(V, \tau_{R'}(Y))$ .

**3.17 Theorem:** Every strongly nano\*generalized b-closed map is nano\*generalized b-closed map.

**Proof:** Let  $B$  be nano closed set in  $(U, \tau_R(X))$ . Since every nano closed set is nano\*generalized b-closed set, then  $B$  is nano\*generalized b-closed in  $(U, \tau_R(X))$ . Since  $f$  is strongly nano\*generalized b-closed map,  $f(B)$  is nano\*generalized b-closed set in  $(V, \tau_{R'}(Y))$ . Therefore  $f$  is nano\*generalized b-closed map.

**3.18 Remark:** The converse of the above theorem need not be true. It is shown by the following example.

**3.19 Example:** Let  $U=\{a,b,c,d\}$  with  $U/R=\{\{b\},\{c\},\{a,d\}\}$  and  $X=\{a,c\}$ , then  $\tau_R(X)=\{U, \Phi, \{c\}, \{a,d\}, \{a,c,d\}\}$ . Let  $V=\{a,b,c,d\}$  with  $V/R'=\{\{a\},\{c\},\{b,d\}\}$  and  $Y=\{a,b\}$ , then  $\tau_{R'}(Y)=\{V, \Phi, \{a\}, \{b,d\}, \{a,b,d\}\}$ . Define  $f:(U, \tau_R(X)) \rightarrow (V, \tau_{R'}(Y))$  be the function defined by  $f(a)=a, f(b)=b, f(c)=c, f(d)=d$ . Here  $f$  is nano\*generalized b-closed map, but not strongly nano\*generalized b-closed map, since  $A=\{a,d\}$  is not nano\*generalized b-closed set in  $(U, \tau_R(X))$ , but  $f(\{a,d\})=\{a,d\}$  is not nano\*generalized b-closed set in  $(V, \tau_{R'}(Y))$ .

**3.20 Theorem:** Every nano\*generalized b-closed map is almost nano\*generalized b-closed map.

**Proof:** It is obvious

**3.21 Remark:** The converse of the above theorem need not be true. It is shown by the following example.

**3.22 Example:** Let  $U=\{a,b,c,d\}$  with  $U/R=\{\{a,b\},\{c,d\}\}$  and  $X=\{a,b\}$ , then  $\tau_R(X)=\{U, \Phi, \{a,b\}\}$ . Let  $V=\{a,b,c,d\}$  with  $V/R'=\{\{a\},\{b\},\{c,d\}\}$  and  $Y=\{a,c\}$ , then  $\tau_{R'}(Y)=\{V, \Phi, \{a\}, \{c,d\}, \{a,c,d\}\}$ . Define  $f:(U, \tau_R(X)) \rightarrow (V, \tau_{R'}(Y))$  be the function defined by  $f(a)=a, f(b)=c, f(c)=b, f(d)=d$ . Here  $f$  is almost nano\*generalized b-closed map, but it is not nano\*generalized b-closed map, since  $A=\{c,d\}$  is nano closed set in  $(U, \tau_R(X))$ , but  $f(\{c,d\})=\{b,d\}$  is not nano\*generalized b-closed set in  $(V, \tau_{R'}(Y))$ .

**3.23 Theorem:** Every strongly nano\*generalized b-closed map is almost nano\*generalized b-closed map.

**Proof:** Let  $B$  be nano regular closed set in  $(U, \tau_R(X))$ . We know that every nano regular closed set is nano closed set and every nano closed set is nano\*generalized b-closed set. Therefore  $B$  is nano\*generalized b-closed set in  $(U, \tau_R(X))$ . Since  $f$  is strongly nano\*generalized b-closed map,  $f(B)$  is nano\*generalized b-closed set in  $(V, \tau_R(Y))$ . Therefore  $f$  is almost nano\*generalized b-closed map.

**3.24 Remark:** The converse of the above theorem need not be true. It is shown by the following example.

**3.25 Example:** Let  $U = \{a, b, c, d\}$  with  $U/R = \{\{b\}, \{c\}, \{a, d\}\}$  and  $X = \{a, c\}$ , then  $\tau_R(X) = \{U, \Phi, \{c\}, \{a, d\}, \{a, c, d\}\}$ . Let  $V = \{a, b, c, d\}$  with  $V/R = \{\{a\}, \{c\}, \{b, d\}\}$  and  $Y = \{a, c\}$ , then  $\tau_R(Y) = \{V, \Phi, \{a\}, \{b, d\}, \{a, b, d\}\}$ . Define  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  be the function defined by  $f(a) = a, f(b) = b, f(c) = d, f(d) = c$ . Here  $f$  is almost nano\*generalized b-closed map, but it is not strongly nano\*generalized b-closed map, since  $A = \{a, b\}$  is nano closed set in  $(U, \tau_R(X))$ , but  $f(\{a, b\}) = \{a, b\}$  is not nano\*generalized b-closed set in  $(V, \tau_R(Y))$ .

**3.26 Remark:** From the above theorem and examples, we have the following diagrammatic representation:

In the above diagram, the numbers 1 – 3 represent the following:

- 1. strongly nano\*generalized b-closed map
- 2. nano\*generalized b-closed map
- 3. almost nano\*generalized b-closed map

**3.27 Theorem:** If  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  is strongly nano\*generalized b-closed map and  $g: (V, \tau_R(Y)) \rightarrow (W, \tau_R(Z))$  is strongly nano\*generalized b-closed map then its composition  $g \circ f$  is strongly nano\*generalized b-closed map.

**Proof:** Let  $B$  be nano\*generalized b-closed set in  $(U, \tau_R(X))$ . Since  $f$  is strongly nano\*generalized b-closed, then  $f(B)$  is nano\*generalized b-closed in  $(V, \tau_R(Y))$ . Since  $g$  is strongly nano\*generalized b-closed, then  $g(f(B))$  is nano\*generalized b-closed in  $(W, \tau_R(Z))$ . Therefore  $g \circ f: (U, \tau_R(X)) \rightarrow (W, \tau_R(Z))$  is strongly nano\*generalized b-closed map.

**3.28 Theorem:** If  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  is almost nano\*generalized b-closed map and  $g: (V, \tau_R(Y)) \rightarrow (W, \tau_R(Z))$  is strongly nano\*generalized b-closed map then its composite  $g \circ f: (U, \tau_R(X)) \rightarrow (W, \tau_R(Z))$  is almost nano\*generalized b-closed map.

**Proof:** It is obvious

**3.29 Theorem:** If  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  and  $g: (V, \tau_R(Y)) \rightarrow (W, \tau_R(Z))$  be two mappings such that their composition  $g \circ f: (U, \tau_R(X)) \rightarrow (W, \tau_R(Z))$  be a nano\*generalized b-closed mapping then the following statements are true:

- (i) If  $f$  is nano continuous and surjective then  $g$  is nano\*generalized b-closed map.
- (ii) If  $g$  is nano\*generalized b-irresolute and injective then  $f$  is nano\*generalized b-closed map.

**Proof**

- (i) Let  $B$  be a nano closed set in  $(V, \tau_R(Y))$ . Since  $f$  is nano continuous  $f^{-1}(B)$  is nano\*generalized b-closed set in  $(U, \tau_R(X))$ . Since  $g \circ f$  is nano\*generalized b-closed map, we have  $(g \circ f)(f^{-1}(B))$  is nano\*generalized b-closed in  $(W, \tau_R(Z))$ . Therefore  $g(B)$  is nano\*generalized b-closed in  $(W, \tau_R(Z))$ , since  $f$  is surjective. Hence  $g$  is nano\*generalized b-closed map.
- (ii) Let  $B$  be nano closed set of  $(U, \tau_R(X))$ . Since  $g \circ f$  is nano\*generalized b-closed, we have  $(g \circ f)(B)$  is nano\*generalized b-closed in  $(W, \tau_R(Z))$ . Since  $g$  is injective and nano\*generalized b-irresolute  $g^{-1}((g \circ f)(B))$  is nano\*generalized b-closed in  $(V, \tau_R(Y))$ . Therefore  $f(B)$  is nano\*generalized b-closed in  $(V, \tau_R(Y))$ . Hence  $f$  is nano\*generalized b-closed map.

**3.30 Proposition:** For any bijection  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  the following statements are equivalent.

- (i)  $f$  is a nano\*generalized b-open map
- (ii)  $f$  is a nano\*generalized b-closed map.
- (iii)  $f^{-1}: (V, \tau_R(Y)) \rightarrow (U, \tau_R(X))$  is nano\*generalized b-continuous.

**Proof**

(i) $\Rightarrow$ (ii) Let  $f$  be nano\*generalized  $b$ -open map. Let  $B$  be nano closed in  $(U, \tau_R(X))$ . Then  $X - B$  is nano open in  $(U, \tau_R(X))$ . By assumption,  $f(X - B)$  is a nano\*generalized  $b$ -open map and it implies  $Y - f(B)$  is a nano\*generalized  $b$ -open map and hence  $f(B)$  is a nano\*generalized  $b$ -closed map.

(ii) $\Rightarrow$ (iii) Let  $B$  be nano closed in  $(U, \tau_R(X))$ . By (ii)  $f(B) = (f^{-1})^{-1}(B)$  is nano\*generalized  $b$ -closed in  $(V, \tau_R(Y))$ .

(iii) $\Rightarrow$ (i) Let  $B$  be nano open in  $(U, \tau_R(X))$ . By (iii)  $(f^{-1})^{-1}(B) = f(B)$  is nano\*generalized  $b$ -open in  $(V, \tau_R(Y))$ .

**3.31 Proposition:** For any bijection  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  the following statements are equivalent.

(i)  $f^{-1}: (V, \tau_R(Y)) \rightarrow (U, \tau_R(X))$  is nano\*generalized  $b$ -irresolute.

(ii)  $f$  is a strongly nano\*generalized  $b$ -open map

(iii)  $f$  is a strongly nano\*generalized  $b$ -closed map.

**Proof:** It is obvious

**4. Nano\*Generalized b-Homeomorphisms**

**4.1 Definition:** A bijection  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  is called nano\*generalized  $b$ -homeomorphism if  $f$  is both nano\*generalized  $b$ -continuous and nano\*generalized  $b$ -open.

**4.2 Theorem**

(i) Every nano homeomorphism is nano\*generalized  $b$ -homeomorphism

(ii) Every nano  $r$ -homeomorphism is nano\*generalized  $b$ -homeomorphism

(iii) Every nano  $c$ -homeomorphism is nano\*generalized  $b$ -homeomorphism

(iv) Every nano  $s$ -homeomorphism is nano\*generalized  $b$ -homeomorphism

(v) Every nano pre-homeomorphism is nano\*generalized  $b$ -homeomorphism

(vi) Every nano  $\alpha$ -homeomorphism is nano\*generalized  $b$ -homeomorphism

**Proof:** Let  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  be a nano homeomorphism. Then  $f$  is nano continuous and nano open. Since every nano continuous function is nano\*generalized  $b$ -continuous and every nano open map is nano\*generalized  $b$ -open,  $f$  is a nano\*generalized  $b$ -continuous and nano\*generalized  $b$ -open. Hence  $f$  is a nano\*generalized  $b$ -homeomorphism. Proof is obvious for others

**4.3 Remark:** The converse of the above theorem need not be true. It is shown by the following examples.

**4.4 Example:** Let  $U = \{a, b, c, d\}$  with  $U/R = \{\{a\}, \{c\}, \{b, d\}\}$  and  $X = \{a, b\}$ , then  $\tau_R(X) = \{U, \Phi, \{a\}, \{b, d\}, \{a, b, d\}\}$ . Let  $V = \{a, b, c, d\}$  with  $V/R = \{\{a, b\}, \{c, d\}\}$  and  $Y = \{a, b\}$ , then  $\tau_R(Y) = \{V, \Phi, \{a, b\}\}$ . Define  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  be the function defined by  $f(a) = b, f(b) = d, f(c) = a, f(d) = c$ . Here  $f$  is nano\*generalized  $b$ -homeomorphism, but it is not nano homeomorphism Since  $f^{-1}\{a, b\} = \{a, c\}$  is nano\*generalized  $b$ -open but nano open.

**4.5 Example:** Let  $U = \{a, b, c\}$  with  $U/R = \{\{a\}, \{b, c\}\}$  and  $X = \{a, c\}$ , then  $\tau_R(X) = \{U, \Phi, \{a\}, \{b, c\}\}$  and Let  $V = \{a, b, c\}$  with  $V/R = \{\{b\}, \{a, c\}\}$  and  $Y = \{a, b\}$ , then  $\tau_R(Y) = \{V, \Phi, \{b\}, \{a, c\}\}$  Define  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  be the function defined by  $f(a) = c, f(b) = b, f(c) = a$ . Here  $f$  is nano\*generalized  $b$ -homeomorphism, but it is not nano  $r$ -homeomorphism, since  $f^{-1}\{b\} = \{b\}$  is nano\*generalized  $b$ -open but nano  $r$ -open.

**4.6 Example:** Let  $U = \{a, b, c\}$  with  $U/R = \{\{a\}, \{b, c\}\}$  and  $X = \{a, c\}$ , then  $\tau_R(X) = \{U, \Phi, \{a\}, \{b, c\}\}$  and Let  $V = \{a, b, c\}$  with  $V/R = \{\{c\}, \{a, b\}\}$  and  $Y = \{b, c\}$ , then  $\tau_R(Y) = \{V, \Phi, \{c\}, \{a, b\}\}$  Define  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  be the function defined by  $f(a) = a, f(b) = b, f(c) = c$ . Here  $f$  is nano\*generalized  $b$ -homeomorphism, but it is not nano  $c$ -homeomorphism, since  $f^{-1}\{a, b\} = \{a, b\}$  is nano\*generalized  $b$ -open but nano  $c$ -open.

**4.7 Example:** Let  $U = \{a, b, c, d\}$  with  $U/R = \{\{a\}, \{b\}, \{c, d\}\}$  and  $X = \{a, c\}$ , then  $\tau_R(X) = \{U, \Phi, \{a\}, \{c, d\}, \{a, c, d\}\}$  and Let  $V = \{a, b, c, d\}$  with  $V/R = \{\{b\}, \{c\}, \{a, d\}\}$  and  $Y = \{a, b\}$ , then  $\tau_R(Y) = \{V, \Phi, \{b\}, \{a, d\}, \{a, b, d\}\}$ . Define  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  be the function defined by  $f(a) = a, f(b) = c, f(c) = b, f(d) = d$ . Here  $f$  is nano\*generalized  $b$ -homeomorphism, but it is not nano  $s$ -homeomorphism, since  $f^{-1}\{b\} = \{c\}$  is nano\*generalized  $b$ -open but nano  $s$ -open.

**4.8 Example:** Let  $U = \{a, b, c, d\}$  with  $U/R = \{\{b\}, \{c\}, \{a, d\}\}$  and  $X = \{b, d\}$ , then  $\tau_R(X) = \{U, \Phi, \{b\}, \{a, d\}, \{a, b, d\}\}$  and Let  $V = \{a, b, c, d\}$  with  $V/R = \{\{a\}, \{c\}, \{b, d\}\}$  and  $Y = \{a, d\}$ , then  $\tau_R(Y) = \{V, \Phi, \{a\}, \{b, d\}, \{a, b, d\}\}$ . Define  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  be the function defined by  $f(a) = a, f(b) = b, f(c) = d, f(d) = c$ . Here  $f$  is nano\*generalized  $b$ -homeomorphism, but it is not nano pre-homeomorphism, since  $f^{-1}\{b, d\} = \{b, c\}$  is nano\*generalized  $b$ -open but nano pre-open.

**4.9 Example:** Let  $U = \{a, b, c, \}$  with  $U/R = \{\{b\}, \{a, c\}\}$  and  $X = \{b, c\}$ , then  $\tau_R(X) = \{U, \Phi, \{b\}, \{a, c\}\}$  and

Let  $V = \{a, b, c\}$  with  $V/R = \{\{a\}, \{b, c\}\}$  and  $Y = \{a\}$ , then  $\tau_R(Y) = \{V, \Phi, \{a\}\}$ .

Define  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  be the function defined by  $f(a) = b$ ,  $f(b) = c$ ,  $f(c) = a$ . Here  $f$  is nano\*generalized b-homeomorphism, but it is not nano  $\alpha$ -homeomorphism, since  $f^{-1}\{a\} = \{c\}$  is nano\*generalized b-open but nano  $\alpha$ -open.

**4.10 Proposition:** For any bijection  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  the following statements are equivalent.

- (i)  $f$  is a nano\*generalized b-open map
- (ii)  $f$  is a nano\*generalized b-homeomorphism
- (iii)  $f$  is a nano\*generalized b-closed map.

#### Proof

(i)  $\Rightarrow$  (ii) Given  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  be a bijective, nano\*generalized b-continuous and nano\*generalized b-open. Then by definition,  $f$  is a nano\*generalized b-homeomorphism.

(ii)  $\Rightarrow$  (iii) Given  $f$  is nano\*generalized b-open and bijective by proposition 3.32,  $f$  is a nano\*generalized b-closed map.

(iii)  $\Rightarrow$  (i) Given  $f$  is nano\*generalized b-closed and bijective by proposition 3.32,  $f$  is a nano\*generalized b-closed map.

**4.11 Remark:** Composition of two nano\*generalized b-homeomorphism need not be nano\*generalized b-homeomorphism.

**4.12 Example:** Let  $U = \{a, b, c, d\}$  with  $U/R = \{\{a\}, \{b\}, \{c, d\}\}$  and  $X = \{b, d\}$ , then  $\tau_R(X) = \{U, \Phi, \{b\}, \{c, d\}, \{b, c, d\}\}$ . Let

$V = \{a, b, c, d\}$  with  $V/R = \{\{a\}, \{c\}, \{b, d\}\}$  and  $Y = \{a, b\}$ , then  $\tau_R(Y) = \{V, \Phi, \{a\}, \{b, d\}, \{a, b, d\}\}$  and  $W = \{a, b, c, d\}$  with

$W/R = \{\{b\}, \{c\}, \{a, d\}\}$  and  $Z = \{a, c\}$ , then  $\tau_R(Z) = \{W, \Phi, \{c\}, \{a, d\}, \{a, c, d\}\}$ .

Define  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  be the function defined by  $f(a) = d$ ,  $f(b) = b$ ,  $f(c) = c$ ,  $f(d) = a$ . and  $g: (V, \tau_R(Y)) \rightarrow (W, \tau_R(Z))$  be the function defined by  $g(a) = a$ ,  $g(b) = b$ ,  $g(c) = d$ ,  $g(d) = c$ . Here  $f$  and  $g$  is nano\*generalized b-homeomorphism, but its composition is not nano\*generalized b-homeomorphism, since  $g \circ f(\{c\}) = \{b\}$  is not nano\*generalized b-open map  $(W, \tau_R(Z))$ .

**4.13 Theorem:** Let  $f: (U, \tau_R(X)) \rightarrow (V, \tau_R(Y))$  be one to one onto mapping. Then  $f$  is nano\*generalized b-homeomorphism if and only if  $f$  is nano\*generalized b-closed and nano\*generalized b-continuous.

**Proof:** Let  $f$  be an nano\*generalized b-homeomorphism. Then  $f$  is nano\*generalized b-continuous. Let  $B$  be an arbitrary nano closed set in  $(U, \tau_R(X))$ . Then  $U - B$  is nano open. Since  $f$  is nano\*generalized b-open,  $f(U - B)$  is nano\*generalized b-open in  $(V, \tau_R(Y))$ . That is  $V - f(B)$  is nano\*generalized b-open in  $(V, \tau_R(Y))$ . Thus the image of every nano closed set in  $(U, \tau_R(X))$  is nano\*generalized b-closed in  $(V, \tau_R(Y))$ .

Conversely, let  $f$  be nano\*generalized b-closed and nano\*generalized b-continuous. Let  $B$  be a nano open set in  $(U, \tau_R(X))$ . Then  $U - B$  is nano closed in  $(U, \tau_R(X))$ . Since  $f$  is nano\*generalized b-closed,  $f(U - B) = V - f(B)$  is nano\*generalized b-closed in  $(V, \tau_R(Y))$ . Therefore  $f(B)$  is nano\*generalized b-open in  $(V, \tau_R(Y))$ . Thus  $f$  is nano\*generalized b-open and nano\*generalized b-homeomorphism.
